

Inspiring Excellence

Network Layer: IPv4 Addressing

Lecture 6 | CSE421 – Computer Networks

Department of Computer Science and Engineering
School of Data & Science

Objectives

- Anatomy of IPv4 Address

- Subnet/Prefix Mask

- Types of Address

- Network
- Host
- Broadcast

- Specific Address

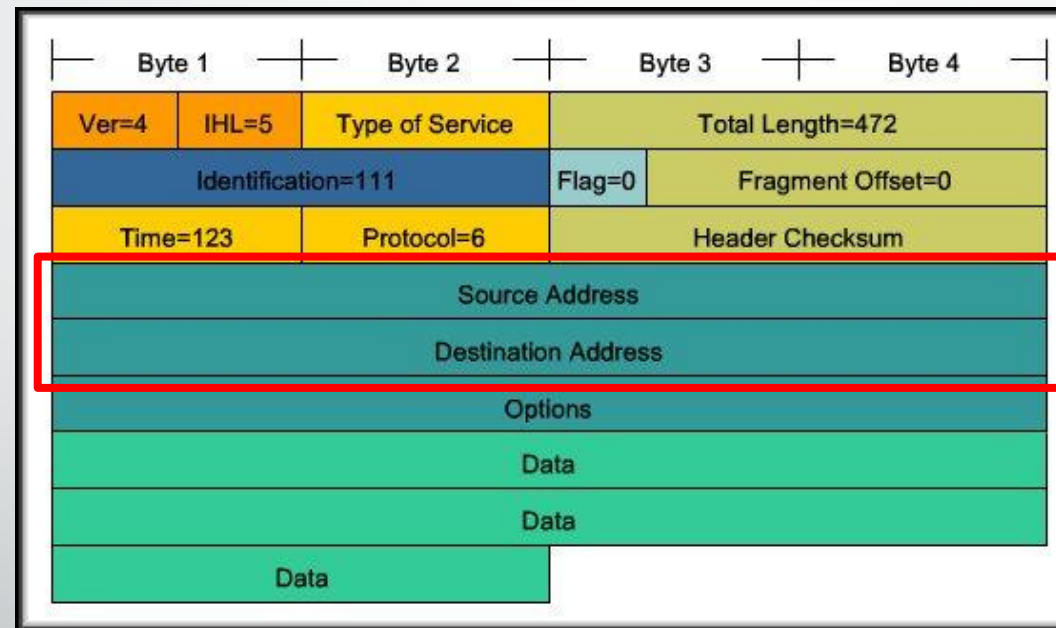

- Unicast
- Multicast
- Broadcast

- Classful IP Addressing

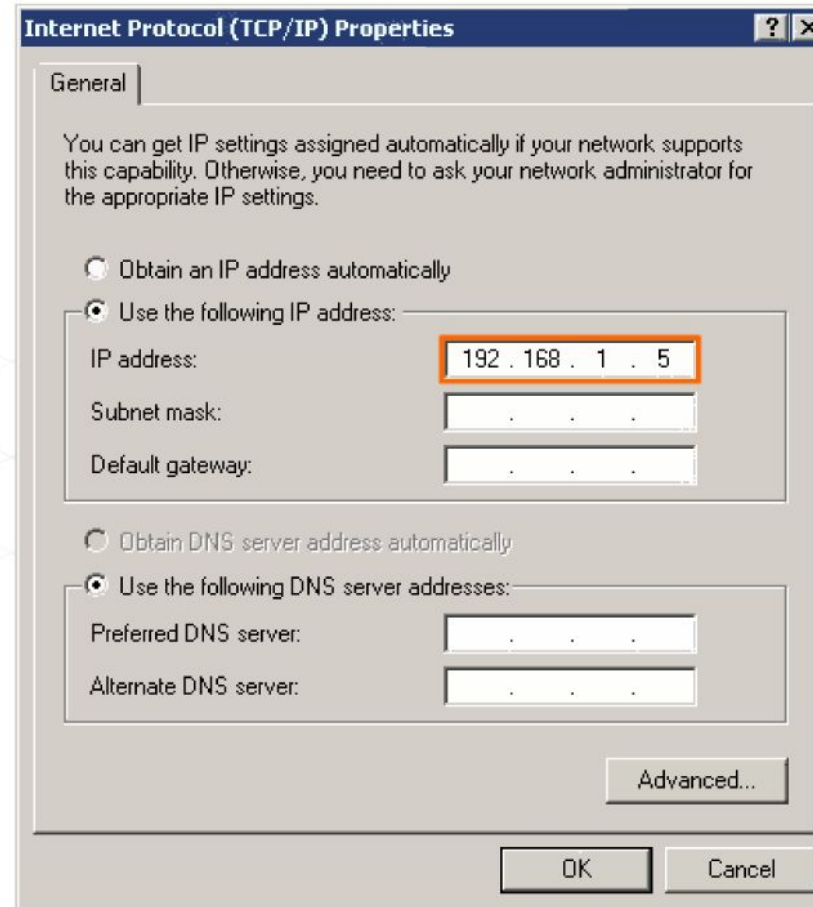

Anatomy of IPv4

Anatomy of an IPv4 Address

- Each device on a network must be uniquely identified at the Network layer.
- For IPv4, a 32 bit source and destination address is contained in each packet.

IPv4 Addressing Structure

Internet Protocol (TCP/IP) Properties

General

You can get IP settings assigned automatically if your network supports this capability. Otherwise, you need to ask your network administrator for the appropriate IP settings.

☐ Obtain an IP address automatically

☒ Use the following IP address:

IP address: 192.168.1.5

Subnet mask: . . .

Default gateway: . . .

☐ Obtain DNS server address automatically

☒ Use the following DNS server addresses:

Preferred DNS server: . . .

Alternate DNS server: . . .

Advanced...

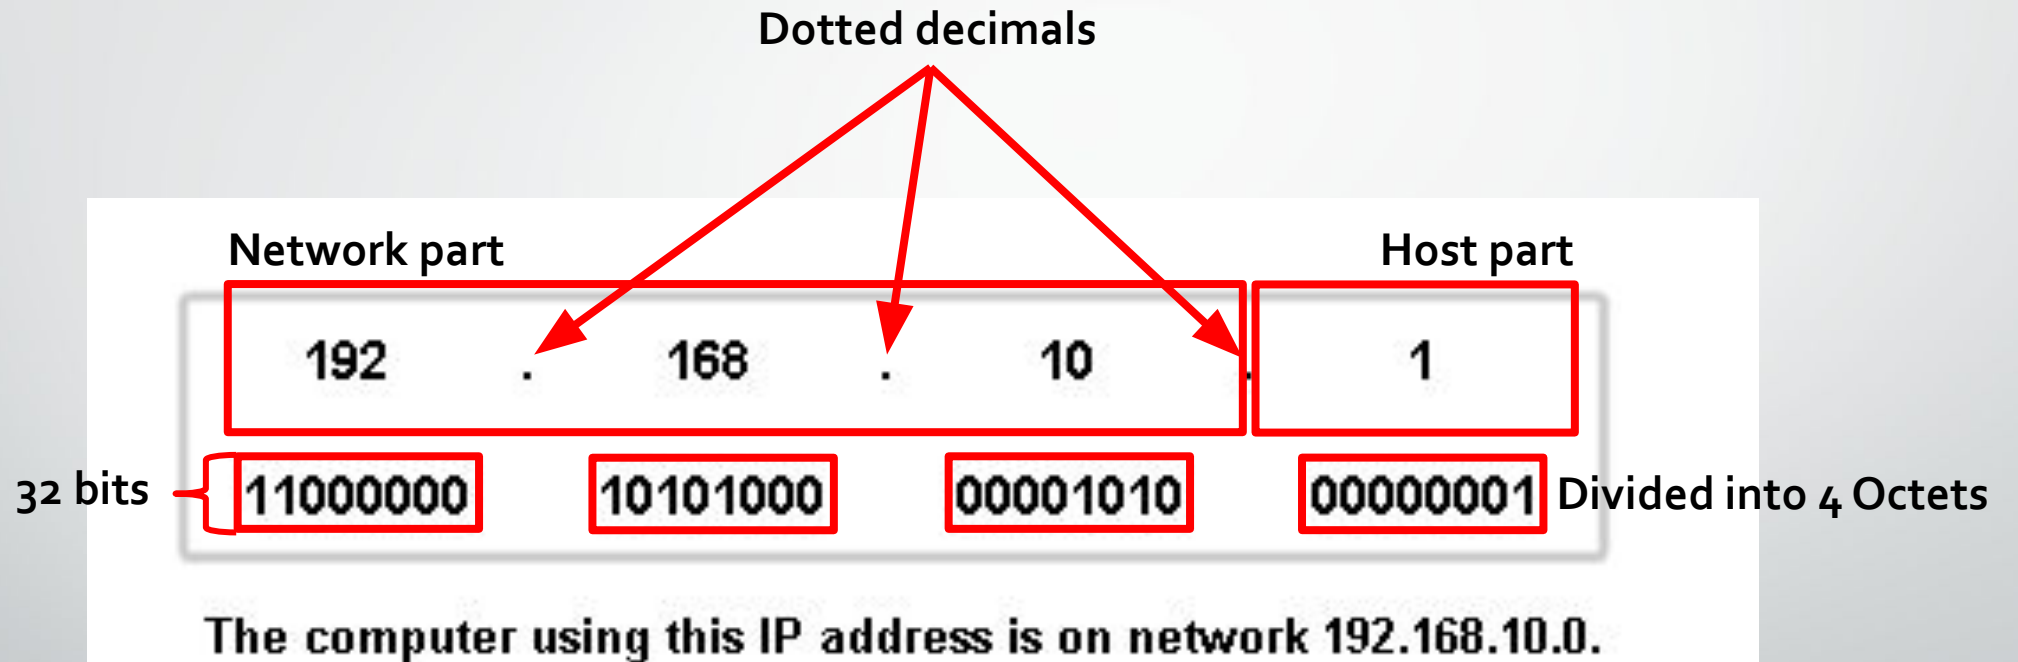

OK Cancel

I see you have
assigned me
an IP address
11000000.1010
1000.00000001.
00000101
Now other
hosts can find
me!

IP version 4 (IPv4) is the current form of addressing used on the Internet.

Anatomy of an IPv4 Address

Binary to decimal and Vice Versa

Binary To Decimal Conversion

Exponent	2^7	2^6	2^5	2^4	2^3	2^2	2^1	2^0
Position	128	64	32	16	8	4	2	1
Bits	1	1	1	1	0	1	0	1
1 BYTE / 1 Octet								
Add these numbers together	128 + 64 + 32 + 16 + 0 + 4 + 0 + 1							
Decimal	245							

A 1 in this position means 64 is added to the total.

A 0 in any position means that 0 is added to the total.

11110101 in Binary = Decimal Number 245

Networks and Hosts

- To identify a path or "route" through a network, the address must be composed of two parts:
 - **Network** portion
 - **Host** portion

Network Portion

- Network Portion:
 - Some portion of the high-order bits
 - A network can be defined as a group of hosts that have identical bit patterns in the network address portion of their addresses

IP Address	192.	168.	1.	2
Binary IP Address	11000000	10101000	00000001	00000010

192.168.1.2	11000000	10101000	00000001	00000010
192.168.1.67	11000000	10101000	00000001	01000011
192.168.1.204	11000000	10101000	00000001	11001100

Network Portion

- Host Portion:
 - A variable number of least significant bits that are called the **host portion** of the address.
 - The **number of bits** used in this **host portion** determines the **number of hosts** that we can

IP Address	192.	168.	1.	2
Binary IP Address	11000000	10101000	00000001	00000010

192.168.1.2	11000000	10101000	00000001	00000010
192.168.1.67	11000000	10101000	00000001	01000011
192.168.1.204	11000000	10101000	00000001	11001100

Prefix Mask

- How do we or devices identify the network part or the host part?
- **Answer:** Using the "Prefix Mask".

- **192.168.10.2/24**

- Means that the **first 24 bits** are the network portion.
- The **last 8 bits** are the host portion.

- **Subnet Mask is the other form of "Prefix Mask"**

- Prefix length

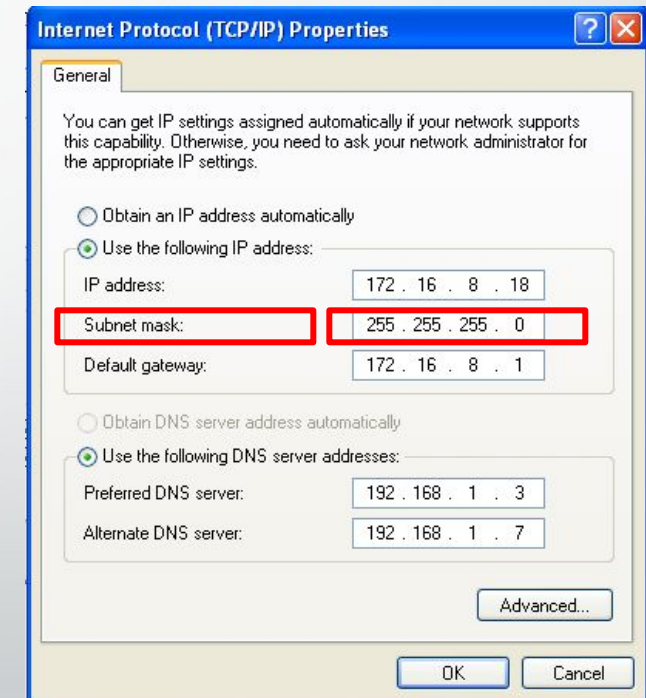

```
Z:\>ipconfig

Windows IP Configuration

Ethernet adapter Local Area Connection:

    Connection-specific DNS Suffix  . : 
    IP Address                       . : 172.16.8.18
    Subnet Mask                       . : 255.255.255.0
    Default Gateway                   . : 172.16.8.1

Z:\>
```

Subnet Mask

- The Prefix Mask and the Subnet Mask are different ways of representing the same information.
- Examples:
 - Prefix Mask of **/24** or a subnet mask of **255.255.255.0**
 - Prefix Mask of **/16** or a subnet mask of **255.255.0.0**
 - Prefix Mask of **/8** or a subnet mask of **255.0.0.0**
- Conversion:
 - Subnet mask has the **same format** as an IP address. Hence, it has **32 bits divided into 8 bits (octets)**
Decimal: **255 . 255 . 255 . 0**
 - Prefix mask of **/24** means, the **first (MSB) 24 bits** of subnet mask would be 1

Exercise

- What's the **subnet mask** of the following?
 - IP Address: 10.24.36.2 / 4
 - IP Address: 10.24.36.2 / 12
 - IP Address: 10.24.36.2 / 16
 - IP Address: 10.24.36.2 / 23
- What's the **prefix mask** of the following?
 - IP Address: 10.24.36.2; Subnet Mask: 255.255.224.0
 - IP Address: 10.24.36.2; Subnet Mask: 255.255.255.192
 - IP Address: 10.24.36.2; Subnet Mask: 255.255.255.252
 - IP Address: 10.24.36.2; Subnet Mask: 255.254.0.0

ANDing the Binaries

- Inside data network devices, digital logic is applied for their interpretation of the addresses.
- AND is used in determining the network address.
 - $0 \text{ AND } 0 = 0$
 - $1 \text{ AND } 0 = 0$
 - $1 \text{ AND } 1 = 1$

	Decimal	Binary
IP Address	135.15.2.1	10000111 00001111 00000010 00000001
Subnet Mask	255.255.0.0	11111111 11111111 00000000 00000000
Network Address	135.15.0.0	

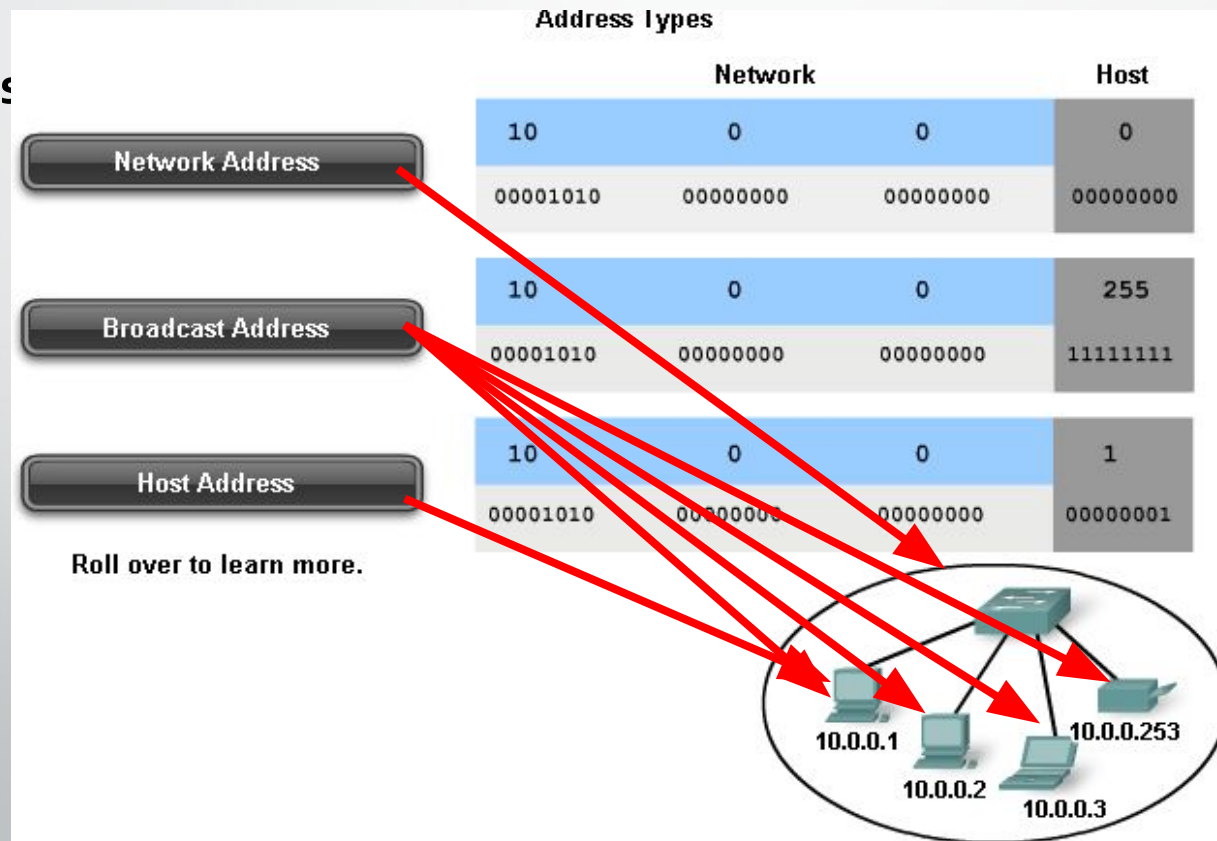

But Why AND?

- **Routers** use the **ANDing** process to determine the route a packet will take.
- The network number of the destination address is used to find the network in the routing table.
- The router then determines the best path for the frame.

Types of Addresses

Types of address

- Every network has
 - **Network Address** – The first IP in the range
 - **Broadcast Address** – The last IP in the range
 - **Host Address**

The Addresses

- Network Address
 - All hosts in the network will have the same network bits.
 - Cannot be assigned to a device.
 - Each host bit in this address will be 0.
- Broadcast Address
 - Cannot be assigned to a device.
 - Each host bit in this address will be 1.
- Host Address
 - The unique address assigned to each device on the network.

For a network of 192.168.10.0/24

The Addresses at a Glance

- Say, you have a random IP address 192.168.10.193/24

[illegible]

Network Prefix

- The network prefix is not always /24.

Using Different Prefixes for the 172.16.4.0 Network

Network	Network address	Host range	Broadcast address
172.16.4.0 /24	172.16.4.0	172.16.4.1 - 172.16.4.254	172.16.4.255
172.16.4.0 /25	172.16.4.0	172.16.4.1 - 172.16.4.126	172.16.4.127
172.16.4.0 /26	172.16.4.0	172.16.4.1 - 172.16.4.62	172.16.4.63
172.16.4.0 /27	172.16.4.0	172.16.4.1 - 172.16.4.30	172.16.4.31

**SAME NETWORK ADDRESS
ALL PREFIXES**

**DIFFERENT BROADCAST
ADDRESS EACH PREFIX**

Special Addresses

Special Addresses

- **Unicast**

- A message addressed to one host

- **Broadcast**

- A message addressed to all hosts on a network.
- Uses network's broadcast address or **255.255.255.255** locally

- **Multicast**

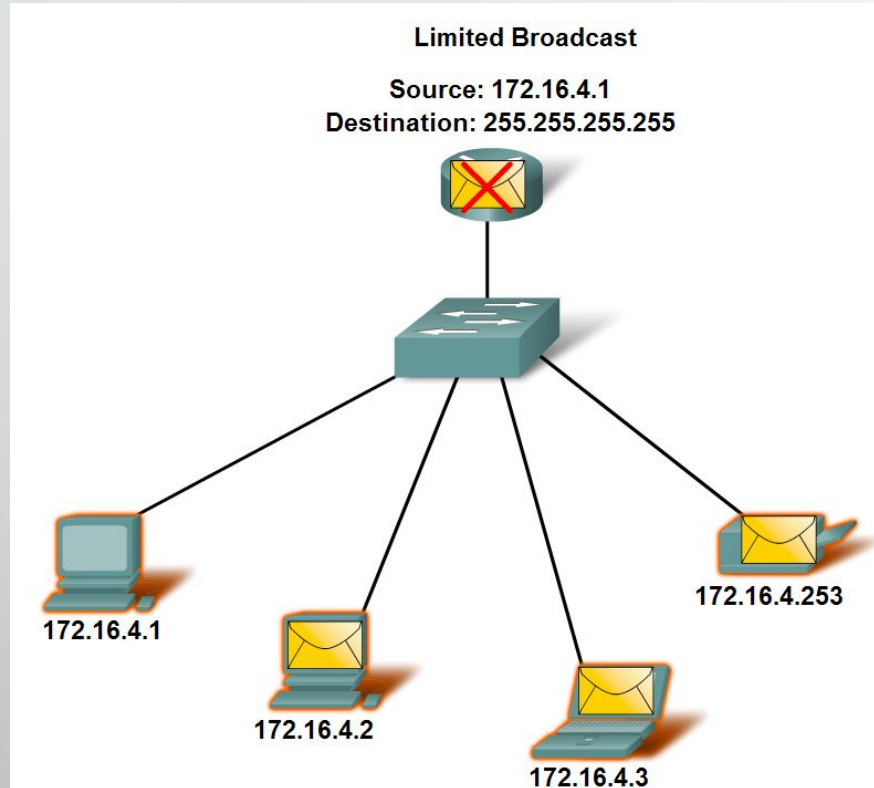

- A message addressed to a group of hosts.
- Uses an IP address starting with **224 - 239**

Unicast

Broadcast Address

- Limited Broadcast

- Directed Broadcast

- For a host outside of the network to communicate with the hosts within the **172.16.4.0 /24** network, the destination address of the packet would be **172.16.4.255**.

Multicast

- Examples of Multicast Application
 - Video and audio broadcasts
 - Routing information exchange
 - Distribution of software
 - News feeds

Classful Addressing

Classful Addressing

Class	High Order Bits	Start	End
Class A	0	0.0.0.0	127.255.255.255
Class B	10	128.0.0.0	191.255.255.255
Class C	110	192.0.0.0	223.255.255.255
Multicast	1110	224.0.0.0	239.255.255.255
Experimental	1111	240.0.0.0	255.255.255.255

Class and Subnet Mask

	Octet 1	Octet 2	Octet 3	Octet 4	Subnet mask
Class A	Network	Host	Host	Host	255.0.0.0 or /8
Class B	Network	Network	Host	Host	255.255.0.0 or /16
Class C	Network	Network	Network	Host	255.255.255.0 or /24

Classful Networks : Range

Address class	First octet range	Number of networks	Hosts per network
Class A	0 to 127	128 (less 0 and 127)	16,777,214
Class B	128 to 191	16,384	65,534
Class C	192 to 224	2,097,152	254

The End
